

EUROstor is partner of AGILESTORAGE

Unified Storage Systems with Quality of Service extend the product range of the storage provider EUROstor.

Filderstadt, Germany, 01.10.2020

Centralized storage solutions offer a number of advantages over decentralized storage structures. They simplify management and allow an efficient distribution of available storage resources.

However, it usually becomes more difficult when other resources, such as bandwidth, controller processing power, etc. come into play: In this case, the backup often slows down the database and high load on one client is at the expense of the others.

AGILESTORAGE systems offer the possibility to make large amounts of data available redundantly to many clients and applications, both as file servers and via block devices. In contrast to many other systems, not only storage capacities can be provided specifically, but also the performance for the individual applications can be controlled precisely (Quality of Service, QoS).

The WASP Center software installed on these systems enables the simple GUI-supported management of all individual systems centrally and across locations. The QoS parameters such as latency, IOPS, bandwidth and capacity of the virtual storage machines (VSM) can also be defined.

Permanent resource monitoring helps to detect bottlenecks in time. Performance can then be optimized by adjusting the parameters, expanding the hardware or moving the affected VMS to another system. The backup of the VSM by replication to one or more additional locations is also centrally controlled. For this purpose, accounts with differentiated access rights can be set up. The system protects the data with a self-healing file system, which also allows practically unlimited snapshots.

EUROstor has now entered into a partnership with AGILESTORAGE to be able to use exactly these advantages in their customer-specific solutions.

"For us this extension of our product portfolio means above all an even better possibility to tailor storage solutions exactly to the requirements of our customers", says Franz Bochtler, Managing Director of EUROstor. "These are highly interesting products which fit perfectly into our concept".

"The partnership with EUROstor is a great chance for AGILESTORAGE to offer first-class service to customers in the German-speaking countries. The combination of the two

companies offers all companies a new, very good alternative for innovative products with performance, flexibility and easy to use storage pools. Each private or hybrid cloud now has a European solution with the best service," said Manfred Felsberg, Board Member and Sales at AGILESTORAGE.

About EUROstor:

EUROstor has been a manufacturer of storage systems since 2004. At the beginning the company produced RAID systems; today server-based systems, operating as flexible storage servers are the main constituents of our product portfolio – perfectly custom-tailored in accordance with the respective requirements. The solutions range from small file servers and CCTV storage to highly-available storage clusters, scale-out clusters and cloud solutions.

EUROstor is based in Filderstadt near Stuttgart and distributes its products to end customers throughout Europe, medium-sized companies, universities, research institutes and computer centers.

Further information about EUROstor storage solutions can be found at <https://www.EUROstor.com>.

About AGILESTORAGE:

AGILESTORAGE is a new Swiss-German manufacturer of innovative storage solutions since 2018. The product WASP (Workload Agnostic Storage Platform) offers companies innovative, high-performance and very easy to use storage platforms for on-premise, private-cloud and hybrid-cloud environments. AGILESTORAGE offers customers a high degree of flexibility based on the hybrid storage pool architecture which fuses rotating disk with flash and supports pure disk or flash pools. In combination with the patented VSM (Virtual Storage Machine) technology, which also has a sophisticated "Quality of Service" framework, AGILESTORAGE has heralded a new era in the efficiency and agility of storage infrastructures.
